## Cambistat Brings You Healthier Trees

Research shows that Cambistat gently slows the growth of trees, allowing the tree to redirect some of its energy from canopy growth to defense chemicals, fibrous root production, and stored energy. The resulting benefit of the reallocation of energy makes your tree healthier and more durable.

### Where to use Cambistat:

- trees too close to houses
- trees near pools, decks, patios & sidewalks
- trees under powerlines
- trees that block scenic views
- trees damaged by disease or insects
- newly transplanted trees
- construction injured trees
- declining and older trees
- trees stressed from drought

Cambistat slows the growth of trees  
40% - 60% over three years.
